

Corner Cabinet Kickstand

When I was making a corner cabinet a few months ago, I discovered that the most difficult part of the project wasn't cutting the miters or even clamping the cabinet together. It was supporting the cabinet on my workbench while working on the face frame.

The solution I arrived at couldn't be simpler. I just attached a couple of clamps to each end of the cabinet, see drawing. Each clamps works like a kickstand on a bicycle, holding the cabinet upright and preventing it from tipping over while I attach the face frame.
