

Miter Gauge "Bookmark"

When cutting miters on my table saw, I sometimes need to change my miter gauge to a different setting, but then return to my original angle to finish the project.

To help me get back to my original setting, I use a piece of tape to "bookmark" the location on my scale, see drawing. Just before I make my first cut, I place a small strip of adhesive tape across the gauge scale and indicator and cut it with a razor blade (so I can reposition the gauge for my next cut).

When I need to return to my first setting, all I do is adjust the miter gauge so the strips of tape are realigned.
